frog

eggs

The life cycle of a frog begins with a fertilized egg. The female lays eggs in big clusters.

tadpole

Young frogs are called tadpoles or polliwogs. They live underwater and breathe through gills.

**tadpole with
legs**

The tadpole grows two hind legs after 5 weeks. Now it is able to leap around.

froglet

After 14 weeks gills develop into lungs and a little froglet emerges from the water.

frog

The froglet's tail shrinks and it grows into an adult frog. It starts to eat insects instead of plants from the water.
